SubSettle

Turning analog bank-transfer subscriptions into auto-reconciled stablecoin billing

The Problem & Our Solution

Subscription businesses without card infrastructure still reconcile bank transfers by hand, delaying activation and causing churn.

- Many SMB subscriptions (B2B SaaS, memberships) are billed via manual bank transfer, not cards
- Staff must manually match incoming transfers to each subscriber's due date every cycle
- Delays in confirmation push back service activation and increase customer churn
- SubSettle assigns each subscriber a recurring stablecoin payment identifier
- Payments auto-reconcile against billing cycles, with alerts for missed or late payments

How It Works

A subscriber-specific payment identifier plus automated matching turns stablecoin transfers into reconciled, auditable billing cycles.

- Merchant onboards subscribers, each gets a recurring stablecoin payment identifier
- Subscriber sends stablecoin payment; Clockwork cron jobs track billing cycle due dates
- On-chain logic auto-matches incoming SPL stablecoin payments to the correct cycle
- Late or missed payments trigger alerts and grace-period logic in the dashboard
- Reconciled funds consolidate into a Squads multisig treasury for secure merchant payout

Built with

Solana, Anchor, Clockwork/cron jobs for billing cycles, Squads multisig, SPL stablecoins, Postgres, React dashboard

Why Now & What's Next

Stablecoins plus Solana speed make automated recurring billing finally viable for SMBs still stuck on manual bank transfers.

- Large segment of SMBs remain outside card/direct-debit networks worldwide
- Solana's speed and low fees make per-cycle stablecoin reconciliation practical
- Squads multisig gives merchants secure, auditable control over payouts
- Next: dunning/retry logic and customer notifications for missed payments
- Next: integrate with existing subscription platforms and add fiat off-ramp support
